

**LIQUID CRYSTAL DISPLAY PANEL AND METHOD FOR MANUFACTURING THE  
SAME**

**Abstract**

A liquid crystal display panel mainly includes a first substrate, a second substrate, a liquid crystal layer sandwiched between the first and the second substrates, and a plurality of first protrusion disposed on the first substrate for maintaining a first cell gap between the first and second substrates. The present invention is characterized by having a plurality of second protrusions disposed on the first substrate for maintaining a second cell gap smaller than the first cell gap when the liquid crystal display panel is subjected to an external force. But when the liquid crystal display panel isn't subjected to any external force, the second protrusion is separated from the second substrate by a distance. The present invention further provides a method for manufacturing the liquid crystal display panel.
